WHAT IS JAVA?

- It is an Object-Oriented Programming Language developed by Sun Microsystems and released in the year 1995.
- Platform independent(i.e. , it can run on any platform).
- Mainly based on the OOPS concept(Object Oriented Programming Systems).
- It can be combined with other technologies like Spring , Hadoop and Android.

Pattabireni, Chennai-600072

WHY JAVA?

Scalability:

- We can achieve scalability by increasing the resources such as RAM and CPU in a single system.

Memory – Management:

- Java provides its own mechanism for managing the memory is known as garbage collection.
- It automatically deletes the objects when they no longer used by the application. It improves the speed of the application.

U. Anand
Director, Department of Information Technology
Gandhi Institute of Technology and Management (GITM)

CORE JAVA CONCEPTS

Java Variables :

- VARIABLES ARE USED TO STORE VALUES.
- VARIABLE TYPES DETERMINE THE MEMORY REQUIRED TO STORE THAT VARIABLE.

U. Smith

Dharmasurthi Rao Bahadur
Chinnaiya Shetty's Hindu College (SHHC)
Pattabiram, Chennai-600072.

COMPONENTS OF JAVA

- JVM: It provides an environment for executing Java Programs.
- JDK: It is a software development environment and it contains the compiler, debugger and other classes to compile and debug a software program.
- JRE: It provides a runtime environment to execute the Java programs and other applications.

Java Identifiers

Variable names must be a unique name.

Unique names are called identifiers. Identifiers can be small names (like a and b) or some other name which provides information about what that variable contains.

Consider the following example

```
int totalSum = 60;
```

```
String color = "Red"
```

U. Smith

Data Types in Java

Consider the following example

```
int num1 = 10; // Integer (whole number)
float numFloat = 10.55f; // Floating point number
char firstCh = 'R'; //
Character boolean firstBl = true; // Boolean
String firstTxt = "Hello"; // String
```

There are two different Data types in Java

Primitive data types - byte, short, int, long, float, double, boolean and char

Non-primitive data types – String , arrays and classes come under non-primitive datatype

Loop

- When a set of statements is executed number of times, then it is called as a loop statement.

Loops In Java : Types

Pattabalam, Chennai-600072

THREE TYPES OF LOOPS:

- **While loop:**
 - Used for executing a set of statements repeatedly.
 - The condition is tested at the beginning before entering the loop.
- **For loop:**
 - It executes a set of statements number of times.
 - Here, the variable initialisation, conditional statement and the variable incrementation all takes place in a single line.
- **do...While loop:**
 - It executes like a while loop except that the condition is tested at the end.

THREE TYPES OF LOOPS:

- While loop
- public class WhileExample {
- public static void main(String[] args) {
- int i=1;
- while(i<=10){
- System.out.println(i);
- i++;
- }
- }
- }

DAY 03

Decision Making:

- When a statement needs to be executed based on a condition, then if statement is used and else block will be executed when the condition is false.
- There are four types of conditional statements:
- **if statement:** First, as the program flows, the condition will be tested and then a statement or group of statements will be executed.
- **if-else statement:** The program checks for the condition.
